

Vyomi — Release 3.0 Roadmap: "From runtime to platform"

Status: **active** · Owner: portal+appliance · Supersedes ad-hoc tier work in v2.2.x Single release (**3.0**), delivered in **three phases**. Phase completions may tag 3.0.0 → 3.0.1 → 3.0.2 , but the release identity stays **3.0**; full 3.0 GA = end of Phase 3.

Why 3.0

v2.2.2 is a **single-developer local runtime** with all-3-cloud fidelity, Docker/VM compute, Terraform, IAM, and a ~70%-built in-browser core (Nano/WASM). **3.0 is the release where Vyomi becomes multi-user and segment-aware** — free in the browser, managed for cohorts, on-prem for enterprise. ~60% of the capability already ships; the net-new center of gravity is a **multi-user control plane + content**.

The two axes

Solutions (the *what*) — a flat, capability-named set (firstshift-style), one flagship:

- ★ **Multi-Cloud Digital Twin** (flagship / platform)
 - Local Cloud Development** — real cloud APIs on localhost, unmodified SDKs/CLIs/Terraform
 - Cross-Cloud Portability** — the same workload across AWS, GCP, Azure
 - Offline & Air-Gapped Cloud** — a full cloud with no account, bill, or network
 - Cloud CI Testing** — ephemeral cloud twin for real integration tests in CI
 - IAM & Policy Testing** — validate IAM/Cedar authorization locally
 - Infrastructure-as-Code** — develop Terraform against the twin, export/promote to prod
 - In-Browser Cloud (Nano)** — the whole simulator in a browser tab, zero install

Segments (the *who*) — our "Industries" equivalent (horizontal product → segment by buyer):

- Universities · Developers · Enterprises · Trainers**
- Enterprises carries three **role lenses** (one offer, three narratives): **DevOps/Platform · Architects · Engineering**

Solutions × Segments (leads-with map)

●● leads · ● supporting · ○ situational · — n/a

Solution	Universities	Developers	Enterprises	Trainers
Local Cloud Development	○	●●	●●	○
Cross-Cloud Portability	○	●	●●	—

Solution	Universities	Developers	Enterprises	Trainers
Offline & Air-Gapped	•	○	••	•
Cloud CI Testing	○	••	••	—
IAM & Policy Testing	○	○	•	○
Infrastructure-as-Code	○	•	••	—
In-Browser Cloud (Nano)	••	••	○	••

Decisions locked (defaults; adjust later)

- **Nav:** primary tabs = the 4 segments + a **Solutions** mega-menu → Logo · Solutions ▾ · Universities · Developers · Enterprises · Trainers · Pricing · Resources ▾ · Get started → (honors the original "4 audience tabs" ask + adds firstshift-style Solutions).
- **Currency:** USD (\$), replacing INR (₹).
- **Pricing (starting points):** Developers \$0 / \$9 / \$19 / \$29 (Free/Lite/Pro/Max); Enterprise ~\$12/dev/mo, min 10; Trainers ~\$39/mo; Universities custom / site license.
- **Payments:** keep Razorpay for India; add a global processor (Stripe / MoR) for USD. Razorpay *can* charge USD (100+ currencies) but settles INR (~5% all-in) unless EEFC; it's an add-on requiring underwriting. → PAYMENT_PROVIDER already abstracts this.
- **URL structure:**

```
/solutions, /solutions/<slug> (7)
/universities /developers /enterprises (+/devops /architects /engineering) /trainers
/pricing Resources ► /docs /downloads /blog /about
```

Phases

3.0 · Phase 1 — Repackage + the free wedge goes live

Ships: portal nav (Solutions/Segments) + 4 segment landing pages + 7 solution pages · **\$ pricing + new SKUs + payment abstraction** · **Nano hosted** (deploy relay, multi-tenant, session persistence) · Developer self-serve onboarding · **Ephemeral/CI profile + GitHub Action** · IaC round-trip polish. Unlocks: **Developers (paid, \$)** · **Free (Nano)**. GA cut line for a credible "3.0 launch": Nano hosted + \$ pricing/SKUs + Solutions/Segments site + Developer self-serve.

3.0 · Phase 2 — Cohorts (the multi-user control plane)

Ships: **Cohort Control Plane** (instructor/trainer dashboard, rosters, per-seat Nano orchestration, shareable lab links, reset-between-sessions, monitoring) · **Content: labs/scenarios/courseware** · LMS/SSO + academic SKU. Unlocks: **Universities** · **Trainers** (shared plane; only dashboards + SKUs differ). Depends on: Phase-1 Nano-hosted being stable.

3.0 · Phase 3 — Enterprise at scale

Ships: **Config-as-code golden environments** + seed data · **Air-gapped + offline license/activation** · **Cost & parity dashboards** · Enterprise role lenses (DevOps/ Architects/Engineering) + SSO/RBAC/audit polish.
Unlocks: **Enterprises** (all three role narratives). Watch: **offline license** is the sneaky-hard item (today licensing phones the portal ~daily).

Workstream → phase

#	Workstream	Phase	Reuse vs new
Portal: nav + pages + \$ + SKUs	P1	new (portal)	
2	Nano productization (deploy relay, host, persist)	P1	~70% built → finish + deploy
3	Ephemeral / CI profile + Action	P1	new
8	IaC round-trip (import + plan/apply)	P1	polish
1	Cohort Control Plane	P2	new (big build)
5	Content: labs / courseware	P2	new (content)
6	Config-as-code environments	P3	new
4	Air-gapped + offline license	P3	new (offline activation = hard)
7	Cost & parity dashboards	P3	new

External blockers (need real resources — scaffolded until provided)

- **Payment:** Stripe/Razorpay-international API keys + business underwriting.
- **Nano hosting:** deploy `relay.vyomi.cloud` (domain + infra) + hosted multi-tenant runner.
- **CI:** publish the GitHub Action to the Marketplace (org + secrets).
- **Universities:** LMS/SSO app registrations (per-institution). These are stubbed in code with clear `TODO(3.0)` markers; no fabricated integrations.

Coordination

Multiple Claude sessions share this checkout. Per project rule: **no self-commits, never `git add -A`, don't edit other sessions' files**. 3.0 portal work lives in the portal repo (`../portal`); appliance work is additive. Nano/WASM is owned by a parallel session — this roadmap consumes its output, does not modify `wasm/` .
